Pull the syringe needle cover away from the syringe. BE CAREFUL ! the needle may be SHARP.

Push the end of the needle though the black spot 2-3cm into the Ready Bag and inject about 2 or 3 cc (2-3 ml.) of the liquid.

Withdraw the needle, and wipe again with an alcohol wipe, before replacing the needle cover. You may inject (inoculate) up to 5 bags with one 10ml syringe.

Stand the Bag up in a warm (78-84 degree) and dark place, or incubate in one of the kits like jars. leave to incubate for 5 to 10 days. Do not touch the white filter patch at the top of the bag, but DO make sure that air can get to the filter, and that the filter is free from the back of the bag.

When successful you will see (depending on species) fluffy or ropey white mycelium running through some of the grains.

Around day 10-15, you may speed things up at this point my mixing/breaking up the contents of the bag.

Complete colonization may take 30 - 40 days depending on species and temperature.
